(Three Times Amended) An adenoviral vector for expressing a heterologous gene(s) in a host cell, comprising, in an orientation opposite to the direction of adenoviral gene transcription, (a) at least one insertion site for cloning a selected heterologous gene; (b) a heterologous promoter positioned upstream from said at least one insertion site, wherein, upon cloning of the selected heterologous gene into said at least one insertion site, said gene is under the regulatory control of said heterologous promoter; (c) a eukaryotic splice acceptor and splice donor site positioned downstream of said promoter and upstream of said at least one insertion site; and (d) a polyadenylation sequence positioned downstream of said insertion site.

20. (Twice Amended) A method of delivering a heterologous gene to an animal heart *in vivo*, wherein the method comprises administering to the animal heart an adenoviral vector comprising, in an orientation opposite to the direction of adenoviral gene transcription, (a) a heterologous gene; (b) a promoter positioned upstream from the heterologous gene, the heterologous gene being under the regulatory control of the promoter; (c) a eukaryotic splice
